REFERENCES
Homeostasis as the Foundation for Feeding
Erin Sundseth Ross, Ph.D., CCC-SLP

Timing: 28:15 minutes

This webinar focuses on the influence of early birth and medical comorbidities on Homeostasis, and the influence of Homeostasis on learning and feeding outcomes. Homeostasis is the foundation for all development and influences the ability and desire to eat. The first challenge for a baby after birth is to establish internal regulation. Brain development requires both a certain level of core stability and repeated experiences. This webinar discusses the theories of dynamic systems and learning. These concepts provide the professional caregiver with an understanding of the importance of stability and the influence of experiences on both short- and long-term feeding outcomes.

OBJECTIVES:

- List the four subsystems of the Synactive Organization of Behavioral Development
- Define "Homeostasis" as it relates to development

AGENDA:

Dynamic Systems Theories: 0:00 – 11:44
Classical Conditioning and Eating: 11:44-17:30
Learned Avoidance and Eating Outcomes: 17:30-28:15
